

Data Dictionary & Field Governance

Version V5.25.0.0.0 · generated 2026-08-06 · this document is produced from the same policy file the app enforces — it cannot drift from the product.

Your edits are yours — how property editing works

Every property starts from the **platform record**: county assessor data, municipal records, and your uploaded deal documents (rent roll, T-12, OM). Nobody edits that record directly.

When you change a field on the Property Card (say Units, or Avg Rent), your change is saved **to your own profile** — a personal overlay on top of the platform record. **You see your values; your colleagues do not.** Their view of the same property is untouched, and their edits are equally invisible to you. Your assumptions stay yours until you choose to share them.

One transition detail: edits made *before* this feature existed live in the deal folder and are treated as shared starting values — everyone still sees those. The first time you save your own edit on a property, your personal copy takes over (for you only) from that point on. Pressing **Reset** clears your personal values and returns you to the automatic ones.

Not every field is editable. Fields are governed in three tiers, defined below, and the tier decides who can change a value and who sees the change.

The three governance tiers

Tier	Who edits	Who sees the change	Where it lives
Enterprise (locked)	Nobody — corrections flow through the data pipeline	Everyone (identical for all)	Platform reference layer, rebuilt nightly
Organization	Org roles, per role preset (none assigned yet in v1)	Everyone in your organization	Org workspace (secured per org)
You (personal)	You	Only you	Your profile (secured per user)

Property Card fields

Field	Tier	Automatic value comes from
Units	You (personal)	Rent roll → T-12 → OM → county record
Year Built	You (personal)	County assessor record
Last Remodel	You (personal)	Deal documents
Class	You (personal)	Deal documents / analyst
Type	You (personal)	Deal documents / analyst (dropdown)

Market	Enterprise (locked)	City + Census / public data (auto)
Submarket	Enterprise (locked)	City + Census / public data (auto)
Occupancy	You (personal)	Rent roll → T-12 → OM
Avg Sqft	You (personal)	Rent roll → OM
Avg Rent	You (personal)	Rent roll → listings → HUD-FMR blend
Rent / Sqft	Enterprise (locked)	Computed: Avg Rent ÷ Avg Sqft
Owner	You (personal)	County record (public)
Manager (person)	You (personal)	Analyst
Mgmt Company	You (personal)	Analyst
PM Software	You (personal)	Analyst (dropdown)
Asset/Fee	You (personal)	Analyst

v1 stance: every hand-editable field is personal. No field is organization-shared yet — fields get promoted to the Organization tier deliberately, one decision at a time, when the owner calls it.

The platform reference layer (all locked)

Parcel identity (APN, FIPS), address, city/state/zip, coordinates, use code, building form, assessed value, owner of record, county sale history, and public market data (HUD, Census, HMDA, FRED). Global, identical for every organization, read-only, refreshed nightly by the platform. Disagree with a value? Override it at your tier — the platform record itself is never edited by hand.

What you see for any field (resolution order)

- 1 Your own saved value for that field (if you ever saved one).
- 2 The shared pre-existing folder value (edits made before per-user profiles, and single-user installs).
- 3 The automatic value: rent roll → T-12 → OM → platform record.

Maintained automatically: this PDF is rebuilt whenever the field policy changes (a test fails if it goes stale). Source of truth: `core/field_policy.py` · docs/DATA-DICTIONARY.md · policy hash 9691456acd5f8af5
